How to Create New Branch in Git (UI Based Approach)

Step 1: Go to below git UI

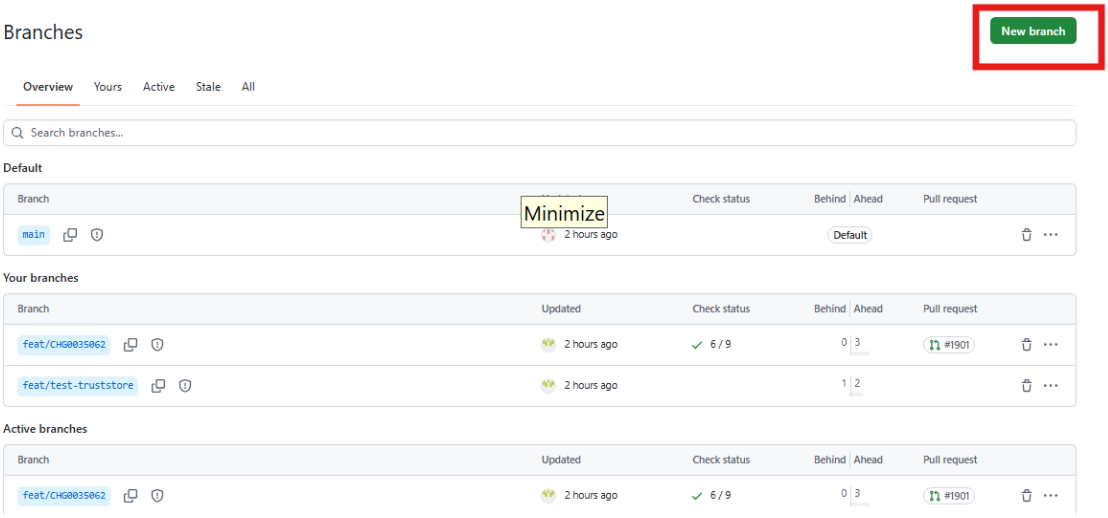

plat-eng/AWS-Landing-Zone

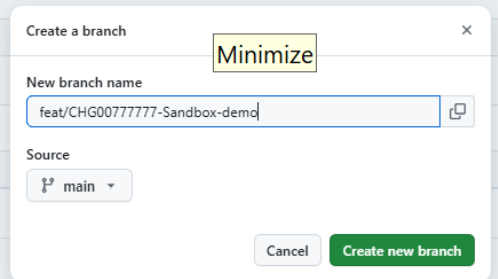

Step 2:Click on on Braches

Step3: Clieck on new branche

Step4: In Popup write the new branch name and click create

Name the branch as per below IMS Instructions

Hi Zensar friends,

Could you please remove stale branches and Pull requests.

Also, please can we be more descriptive with Pull Requests naming, this will make it easier to identify. Please follow following principles for PR naming:

- Name should be short and descriptive
- If the PR is linked to a Change record, please prefix the ServiceNow reference.
- If the change is linked to a specific AWS account, please reference the account
- If the change is linked to a specific resource, please reference the resource

And the following for branch naming;

Structure: type/JIRA-ID-short-description

- **Prefix (type):**
  - **feat/**: New features.
  - **fix/**: Bug fixes for existing releases.

    - **chore/**: Maintenance tasks, dependency updates, or IaC changes.
    - **docs/**: Documentation only changes.
    - **hotfix/**: Urgent production fixes.
- **Ticket ID (JIRA-ID):** The unique identifier from the Jira board (e.g., OPS-102, DEV-455).

Description: Lowercase, hyphens used as separators.

Examples:

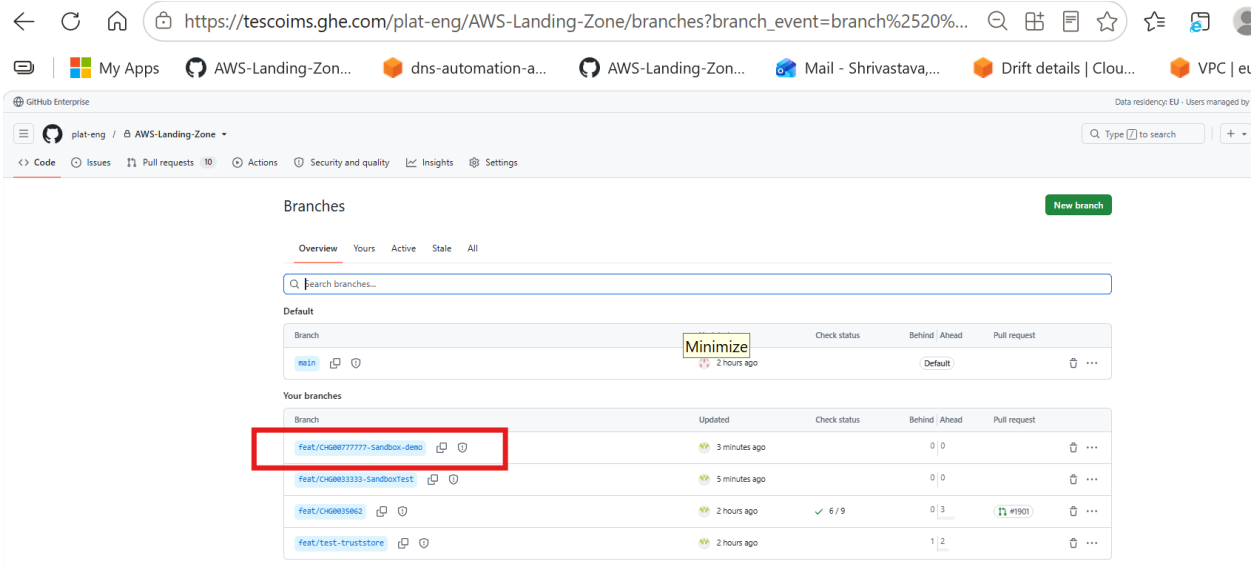

- feat/PROJ-123-add-audit-logging
- fix/OPS-404-patch-memory-leak
- chore/PLAT-99-terraform-upgrade
